

# **User Stories**

Team 5: Elliot K., Sanjana K., Fabian A., Zeshi W.

## **User Story 1: (User Login Page)**

- Users are prompted to login through Spotify
  - **Login** prompts user to login through Spotify account
    - **Successful Login** takes user to Landing Page (User Story 2)
    - **Unsuccessful Login** occurs in the event of invalid login credentials or non-existent account

## **User Story 2: (User Landing Page)**

As a valid user, I want to be able to login (User Story 1). In this stage, the page would either display or not. Unlikely to work incorrectly because the user would only land on this page if they were authenticated.

## **User Story 3:**

As a logged-in user (User Story 1) I want to be able to see the weather status from the website page so that I can figure out what is the specific weather that my song playlists have been generated from. The page would display the weather conditions based on current location by using the weather API

## **User Story 4: PRIMARY (Generate Playlists)**

As a user I want a generated playlist depending on the weather. an easy way to generate my daily playlist. There should be a big button to generate playlists from Landing Page (User Story 2). The process would be automatic. When this process is executed the newly generated playlist would be displayed to the page. The Playlist would be linked to that day's weather which can be seen on the site (User Story 4).
