

User Stories

Team 5: Elliot K., Sanjana K., Fabian A., Zeshi W.

User Story 1: (User Login Page)

- Users are prompted to login or create a new account.
 - **Login** prompts user to login through Spotify account
 - **Successful Login** takes user to Landing Page (User Story 2)
 - **Unsuccessful Login** occurs in the event of invalid login credentials or non-existent account
 - **New Account Creation** prompts user to create a new account through an existing Spotify account and input location
 - **Successful Creation** takes user to Landing Page (User Story 2)
 - **Unsuccessful Creation** displays a failure message in the event no Spotify account exists

User Story 2: (User Landing Page)

As a valid user, I want to be able to login (User Story 1) and see all the new playlists that were created by the app. In this stage, the page would either display or not. Unlikely to work incorrectly because the user would only land on this page if they were authenticated. If it displays correctly, the appropriate playlists would display or it would say that there are no playlists yet. When the playlists are generated (User Story 5) they will be displayed here.

User Story 3:

As a logged-in user (User Story 1) I want to be able to go to my profile to check my personal information. The page should display my name and the credentials that I logged in with (User Story 1): Spotify username, email, password, etc. The page should allow me to change my password from the profile checking page as well.

User Story 4:

As a logged-in user (User Story 1) I want to be able to see the weather status from the website page so that I can figure out what is the specific weather that my song playlists have been generated from. The page would display the weather conditions based on current location by using the weather graph directly above on the playlist generate button.

User Story 5: PRIMARY (Generate Playlists)

As a user I want an easy way to generate my daily playlist. There should be a big button that says “Generate Today's Playlist” to generate playlists from Landing Page (User Story 2). The process would be automatic on all the playlist of the user. When this process is executed the newly generated playlist would be displayed to the landing page (User Story 2). The Playlist would have a name and be linked to that day's weather which can be seen on the site (User Story 4).

Team 5: Elliot K., Sanjana K., Fabian A., Zeshi W.

User Story 6:

As a logged in User (User Story 1) I want to be able to add and delete songs from the generated playlists. I should be able to click on a song to remove it from the playlist. There should also be a button for me to add songs to the generated playlist.
